

User Acceptance Testing (UAT) Template

Date	22 September 2026
Team ID	SWTID-2026-8694
Project Name	AI BLOGNEST API
Maximum Marks	4 Marks

Project Overview:

Project Name: AI BLOGNEST API

Project Description: A backend REST API for blog management using Node.js, Express.js, MongoDB and Mongoose, with CRUD operations, validation, authentication-related functionality and AI-assisted blog/content support.

Project Version: 1.0

Testing Period: 22/09/2026 to 24/09/2026

Testing Scope:

- API availability and server response
- Blog CRUD operations: Create, Read, Update and Delete
- Login/authentication-related API functionality
- Request validation and error handling
- MongoDB database connectivity and data persistence
- JSON response format and API endpoint testing

User Stories / Requirements to be Tested:

- As a user, I should be able to access the API.
- As a user, I should be able to create and manage blog data.
- As a user, I should receive valid JSON responses for API requests.
- As a user, invalid requests should return appropriate errors.
- As an application developer, I should be able to test the API using Postman/Thunder Client.

Testing Environment:

URL/Location: http://localhost:5000

Credentials (if required): Not required for basic API testing

Testing Tool: Postman / Thunder Client

Database: MongoDB

Test Cases:

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	API server availability	1. Start the server 2. Open http://localhost:5000	API should return the configured running message.	API returned the running response.	Pass
TC-002	MongoDB connection	1. Start the API 2. Check server/database connection	Application should connect to MongoDB successfully.	MongoDB connection was established.	Pass
TC-003	Login API	1. Send POST request to /login 2. Provide valid request data	API should process the login request and return a response/token as configured.	Login endpoint returned the expected response.	Pass
TC-004	Create blog / POST	1. Send POST request to the blog endpoint 2. Provide valid	A new blog record should be created and returned in the response.	Blog data was accepted and returned.	Pass

		blog data			
TC-005	Read blog / GET	1. Send GET request 2. Check returned blog data	API should return the requested blog data in JSON format.	GET request returned JSON data.	Pass
TC-006	Update blog / PUT	1. Select an existing blog 2. Send PUT request with updated data	Existing blog data should be updated successfully.	Update request returned the expected response.	Pass
TC-007	Delete blog / DELETE	1. Select an existing blog 2. Send DELETE request	Selected blog should be deleted successfully.	Delete request returned the expected response.	Pass
TC-008	Invalid request validation	1. Send incomplete/invalid data 2. Check API response	API should reject invalid data and return an appropriate error response.	Validation/error response was returned.	Pass

Bug Tracking:

Bug ID	Bug Description	Steps to reproduce	Severity	Status	Additional feedback
BG-001	No critical bug recorded during UAT.	N/A	Low	Closed	API testing completed successfully; continue regression testing after future changes.

Sign-off:

Notes:

- Ensure that all test cases cover both positive and negative scenarios.
- Encourage testers to provide detailed feedback, including any suggestions for improvement.
- Bug tracking should include details such as severity, status, and steps to reproduce.
- Obtain sign-off from both the project manager and product owner before proceeding with deployment.
